## 2. What's New

This release contains the following updates and new features.

#### **Notable Changes**

This is the list of the notable issues fixed in this release.

Issue ID	
JDK-8306412	Summary: Use server cipher suites preference by default  Description: The server now uses its cipher suite preference so that it can have more control over the security parameters of each connection.
JDK-8310125	Summary: Throw error if default java.security file is missing  Description: If the java.security file is missing from a JDK/JRE install, the JDK now thows an error instead of simply reverting to a minimal/old set of security configuration settings.
JDK-8310202	Summary: JCE did not provide any class to handle RSA private key in PKCS#1  Description: It was not possible to read RSA private key in PKCS #1 using Sun JCE. A factory was added to read PKCS#1 encoded private key.
JDK-8310509	Summary: KeyStore of type KeychainStore provider Apple did not show all trusted certificates  Description: JDK-8278449 changed the behavior of the MacOS Keystore implementation (KeychainStore, provider "Apple") to only show certificates with proper trust. However, the implementation did not show all possible trusted certificates. Certificates were only loaded if a trust record in the "user domain" existed. This was not sufficient as there might as well be records in the domains "admin" or "system".

What's New Chapter 2

Issue ID	
JDK-8311496	Summary: Have -XshowSettings option display tzdata version
	Description: The -XshowSettings:all option now displays the tzdata version along with other information.
JDK-8311770	Summary: Increased the default TLS Diffie-Hellman group size from 1024-bit to 2048-bit
	Description: The JDK implementation of TLS 1.2 used a DH keysize of 1024 bits (chosen by the server) when a TLS_DHE cipher suite was negotiated and either the client or server did not support FFDHE to negotiate a stronger keysize. The 1024-bit DH keys are known to be weak and are no longer recommended.
JDK-8312541	Summary: Removed SECOM certificate that expired in September 2023
	Description: A SECOM certificate (OU=Security Communication RootCA1, O=SECOM Trust.net, C=JP) expiring in September 2023 was removed.
JDK-8314664	Summary: Invalid CEN header (invalid zip64 extra data field size)
	Description: The following ZipException was thrown when the data contained in the CEN Extra fields was ambiguous: Invalid CEN header (invalid zip64 extra data field size).
JDK-8315608	Summary: Added Certigna Root CA - 2
	Description: The Certinga root certificate has been added to the cacerts truststore.

#### Graal support in Liberica JDK 11

Liberica JDK continues to provide support for AOT and Graal JIT. Since in OpenJDK 11 builds these features are deemed experimental and deprecated, it is recommended to compile native executables with <u>Liberica Native Image Kit</u> to avoid errors.
